

In this practical we use the open source Identity and Access Management (IAM) tool, WSO2 Identity Server, to practice how to write and deploy XACML policies. Here is a set of steps you should take:

1. Download WSO2 Identity server: <https://wso2.com/identity-and-access-management/>
2. Follow the start guide to run the server: <https://is.docs.wso2.com/en/latest/get-started/quick-start-guide/>
3. Follow the examples to write and generate XACML policies: <https://is.docs.wso2.com/en/latest/learn/access-control/>

WSO2 Identity server provides graphical user interfaces for users to set up authentication and authorisation security mechanisms. Excellent tool!
